

IMPORTANT SAFETY REMINDER

SAFE HANDLING OF COREGAS 6-PACKS

Coregas reminds you of the need to ensure the safe handling of Coregas 6-packs, especially in cases where uneven ground and inexperienced forklift operators are involved.

Please ensure that you follow these practices in handling 6-packs:

- 6-packs should be transported only when securely strapped within cylinder pallets.
- 6-packs should not be removed from cylinder pallets.
- 6-packs should be moved using a pallet jack or forklift only.
- When moving a 6-pack with a pallet jack or forklift, the tines should reach fully through the 6-pack so support is provided to the framework of the pack.
- 6-packs should be handled carefully to avoid frame or manifold damage.
- The weight distribution on forklift tines should be even to avoid instability.
- 6-packs should be stored on solid, level ground.

Please contact your local sales representative or our Customer Service team if you have any questions about the safe handling of Coregas 6-packs.
